PROJECT DETAILS

TITLE: Blind Torch

This project helps visually challenged people to navigate with ease using advanced technology. My project includes an Ultrasonic sensor, that detects the presence of any obstacles in the walking path of the blind people and sends the data to the microcontroller (Atmega 328). The Microcontroller then calculates the distance of the obstacle by counting the time taken between the transmission and reception of the ultrasonic waves. If the obstacle is close enough then the microcontroller sends the signal to sound a buzzer. The system also provides another precious option of finding the blind stick if the visually challenged people forget, where they kept it.
